EXECUTIVE SUMMARY

This analysis evaluates the portfolio health of a large beauty e-commerce platform by examining 8,485 products across 41 secondary categories. Rather than describing surface-level performance metrics, the goal was to determine which categories justify their current portfolio footprint and where the business should grow, maintain, or rationalise its assortment.

Using four dimensions (customer engagement, satisfaction, review intensity, and stockout risk), each secondary category was assigned a Portfolio Role: Grow, Maintain - High Potential, Maintain, Review, or Rationalise.

Key findings include:

- Only 2 categories, Cheek and Makeup Palettes, qualify as Grow, demonstrating strong performance across both engagement and satisfaction dimensions.
- 10 categories are flagged for Review, indicating underperformance in one or more critical dimensions relative to their portfolio presence.
- Skincare subcategories consistently show high satisfaction but low engagement, representing the portfolio's most significant missed opportunity.
- Stockout risk is concentrated in high-value categories, with Value and Gift Sets at 20% and Accessories at 18%, creating direct revenue loss risk.

The analysis concludes with targeted recommendations for assortment prioritisation, visibility investment, and inventory management.

BUSINESS PROBLEM AND OBJECTIVE

Business Problem

Large beauty portfolios are often managed using surface-level metrics such as total product count, popularity, and revenue contribution. While these signals are useful, they do not always reveal whether a category is genuinely earning its place in the assortment.

A category can attract high customer engagement while delivering poor satisfaction. Another can show strong ratings while remaining largely invisible to customers. Without a structured way to evaluate categories across multiple dimensions simultaneously, portfolio decisions risk being driven by incomplete signals, leading to over-investment in underperforming segments and missed opportunities in high-potential ones.

The core business question guiding this analysis is:

"Which secondary categories are underperforming relative to their portfolio footprint, and where should the business grow, maintain, or rationalise its assortment?"

Objective

The objective of this project is to build a repeatable, evidence-based Portfolio Health Scorecard that evaluates each secondary category across four business-relevant dimensions:

- Customer engagement (loves count)
- Customer satisfaction (average rating)
- Customer activity (review intensity)

- Operational health (stockout risk)

The scorecard assigns each category a Portfolio Role to support prioritisation decisions around assortment investment, visibility, and inventory management.

DATASET AND METHODOLOGY

Dataset Overview

The dataset contains product-level information from a large beauty e-commerce platform, covering 8,493 products across 27 attributes. Each row represents one product, enabling portfolio-wide comparison across brands, categories, and price tiers.

The dataset included the following attribute groups:

- Product identifiers: product ID, product name, brand ID, and brand name
- Customer signals: loves count (number of users who saved the product as a favourite), average rating, and number of reviews
- Pricing information: regular price, value price (displayed potential saving), and sale price, all in US dollars
- Merchandising flags: binary indicators for limited edition, new, online only, out of stock, and Sephora exclusive status
- Product attributes: size, variation type, variation value, variation description, ingredients, and highlights
- Category structure: primary, secondary, and tertiary category classifications
- Variant metadata: child count, child minimum price, and child maximum price

Data Preparation and Cleaning

The dataset was cleaned and prepared in Power Query before analysis. The following steps were applied:

- Columns with no analytical value for category-level assessment were removed, including ingredients, variation details, size, highlights, and brand identifiers.
- The dataset was checked for duplicate records. No duplicates were identified.
- Data types were standardised across numerical and categorical fields.
- 8 products with missing secondary category values were excluded from the analysis, as secondary category is the primary unit of analysis. This resulted in a working dataset of 8,485 products.
- Missing rating and review values (278 products) were retained as nulls and excluded from satisfaction calculations rather than filled, to preserve the integrity of average rating figures.
- Missing child minimum and maximum price fields were retained as nulls, reflecting products with no variant structure.

Derived Variables

Three additional columns were created in Excel to support the analysis:

- Final Price: sale price where available, otherwise regular price

- Price Segment: Budget (under $30), Mid ($30 to $70), Premium (above $70). Created at product level as contextual information only, and not included in the scorecard as aggregating price to category level would mask the price distribution within each category
- Has Variants: a binary flag indicating whether a product offers variant options, based on child count

Analytical Approach

The analysis operated at the secondary category level. Primary category (9 values) was too broad to generate actionable insights, while tertiary category (118 values) was too granular for reliable averages. Secondary category (41 values) provided the right balance between specificity and statistical confidence.

Four pivot tables were built to calculate the following metrics per secondary category:

- Average loves count (engagement density)
- Average rating, excluding unrated products (satisfaction score)
- Average review count (review intensity)
- Average out of stock rate expressed as a percentage (stockout risk)

Each metric was converted into a 1 to 3 score using defined thresholds, and the scores were combined into a Portfolio Role assignment using structured IF logic in Excel.

Scorecard Thresholds

Metric	***Score 1***	***Score 2***	***Score 3***
Avg Loves	Below 15,000	15,000 to 40,000	Above 40,000
Avg Rating	Below 4.0	4.0 to 4.3	Above 4.3

Portfolio Role Logic

Condition	***Portfolio Role***
Engagement 3 and Satisfaction 3	Grow
Engagement 1 and Satisfaction 1	Rationalise
Engagement 3 or Satisfaction 3	Maintain - High Potential
Engagement 1 and Satisfaction 2, or Engagement 2 and Satisfaction 1	Review
All other combinations	Maintain

CATEGORY LANDSCAPE

Portfolio Overview

The working dataset of 8,485 products spans 8 primary categories and 41 secondary categories. Before examining individual category health, it is useful to understand how the portfolio is structured at the primary level and what each category contributes in terms of size, engagement, and satisfaction.

Primary Category	*Products*	*Secondary Categories*	*Avg Loves*	*Avg Rating*	*Avg Reviews*	*Stockout %*
Skincare	2,420	13	27,111	4.23	464	5%
Makeup	2,368	10	54,243	4.15	682	9%
Hair	1,464	6	13,710	4.20	254	4%
Fragrance	1,430	5	12,753	4.23	263	11%
Bath and Body	405	9	16,454	4.20	199	7%
Mini Size	287	6	26,742	4.01	722	10%
Men	59	5	4,808	4.50	68	8%
Tools and Brushes	52	4	14,989	4.27	220	4%

Key Observations

Makeup is the portfolio's primary engagement engine, generating the highest average loves count at 54,243, nearly double that of Skincare. However it carries the lowest average rating in the portfolio at 4.15. While this remains a strong rating in absolute terms, it is notable given Makeup's dominant engagement position, and the internal split within the category is examined in detail in the deep dive section.

Skincare is the largest category by product count with 2,420 products and also the most complex with 13 secondary categories. It delivers a stronger average rating than Makeup but attracts significantly less customer engagement. This pattern signals an underleveraged category where quality is not being matched by visibility.

Fragrance and Mini Size both carry elevated stockout rates at 11% and 10% respectively, the highest in the portfolio. Despite representing very different price points and customer intentions, both categories are regularly failing to meet demand.

Men is the smallest category by product count at 59 products but delivers the highest average rating in the portfolio at 4.50, indicating strong customer satisfaction within a niche segment that may be underrepresented in the assortment.

Tools and Brushes has the lowest stockout rate at 4% alongside a solid average rating of 4.27, suggesting a well-managed and stable category.

Structural Insight

The primary category landscape reveals a consistent tension across the portfolio: the categories attracting the most customer attention are not always delivering the strongest satisfaction. This pattern is examined in detail at the secondary category level in the following section.

PORTFOLIO HEALTH SCORECARD

Overview

The Portfolio Health Scorecard evaluates all 41 secondary categories across four dimensions: engagement density, satisfaction score, review intensity, and stockout risk. Each category is assigned a Portfolio Role based on its combined engagement and satisfaction scores, providing a structured basis for assortment prioritisation decisions.

The full scorecard is presented below, sorted by average loves count in descending order.

Secondary Category	***Avg Loves***	***Avg Rating***	***Avg Reviews***	***Stockout %***	***Engagement Score***	***Satisfaction Score***	***Portfolio Role***
Cheek	77,177	4.32	648	4%	3	3	Grow
Lip	70,419	4.21	540	11%	3	2	Maintain - High Potential
Lip Balms and Treatments	69,159	4.15	1,006	10%	3	2	Maintain - High Potential
Face	63,641	4.14	901	8%	3	2	Maintain - High Potential
Makeup Palettes	52,083	4.51	265	10%	3	3	Grow
Eye	47,127	4.05	835	7%	3	2	Maintain - High Potential
Bath and Body	39,594	4.38	1,816	0%	2	3	Maintain - High Potential
Makeup	36,916	3.93	846	13%	2	1	Review
Treatments	36,468	4.31	489	4%	2	3	Maintain - High Potential
Masks	32,370	4.26	426	10%	2	2	Maintain
Fragrance	32,153	3.87	150	7%	2	1	Review
Cleansers	29,094	4.31	565	4%	2	3	Maintain - High Potential
Mini Size	27,304	4.07	599	7%	2	2	Maintain
Moisturizers	25,823	4.28	551	4%	2	2	Maintain
Brushes and Applicators	24,899	4.31	228	13%	2	3	Maintain - High Potential
Eye Care	23,900	4.11	406	5%	2	2	Maintain
Beauty Tools	22,378	4.03	366	4%	2	2	Maintain

Sunscreen	22,175	4.13	375	4%	2	2	Maintain
Accessories	20,160	4.05	490	18%	2	2	Maintain
Bath and Shower	19,455	4.20	199	4%	2	2	Maintain
Shop by Concern	18,782	3.90	214	0%	2	1	Review
Hair Styling and Treatments	17,050	4.24	289	3%	2	2	Maintain
Body Moisturizers	16,844	4.24	231	5%	2	2	Maintain
Women	16,822	4.23	348	9%	2	2	Maintain
Self Tanners	14,353	3.94	201	9%	1	1	Rationalise
Nail	14,350	3.88	79	8%	1	1	Rationalise
Skincare	13,115	4.35	607	6%	1	3	Maintain - High Potential
Wellness	13,020	4.12	133	5%	1	2	Review
Hair	11,976	3.90	253	7%	1	1	Rationalise
High Tech Tools	11,679	4.14	78	9%	1	2	Review
Shampoo and Conditioner	11,028	4.21	279	3%	1	2	Review
Value and Gift Sets	11,025	4.14	57	20%	1	2	Review
Body Care	10,012	4.16	122	9%	1	2	Review
Tools	9,253	4.07	97	3%	1	2	Review
Beauty Accessories	8,471	4.32	41	0%	1	3	Maintain - High Potential
Hair Tools	8,057	4.50	61	0%	1	3	Maintain - High Potential
Men	7,587	4.55	319	11%	1	3	Maintain - High Potential
Beauty Supplements	6,759	4.42	168	0%	1	3	Maintain - High Potential
Other Needs	4,432	4.68	48	0%	1	3	Maintain - High Potential

Shaving	4,035	4.64	81	13%	1	3	Maintain - High Potential
Candles and Home Scents	2,733	4.02	24	5%	1	2	Review

Portfolio Role Distribution

Portfolio Role	***Count***	***% of Portfolio***
Grow	2	5%
Maintain - High Potential	15	37%
Maintain	11	27%
Review	10	24%
Rationalise	3	7%

Scorecard Findings

Only 2 categories, Cheek and Makeup Palettes, meet the criteria for Grow status, excelling in both engagement and satisfaction. These represent the portfolio's strongest performers and the clearest candidates for continued investment.

15 categories sit in the Maintain - High Potential bucket, representing the largest group in the portfolio. These categories demonstrate strength in either engagement or satisfaction but not both. They represent genuine growth opportunities if the right lever (visibility or quality improvement) is applied.

11 categories are classified as Maintain, scoring average across engagement and satisfaction. These categories are stable but not driving meaningful growth. They require monitoring rather than active investment.

10 categories are flagged for Review, showing weakness in one or more dimensions. These categories warrant closer examination before continued investment is justified.

3 categories, Self Tanners, Nail, and Hair, are classified as Rationalise, underperforming across both engagement and satisfaction. These represent the clearest candidates for assortment reduction or strategic repositioning.

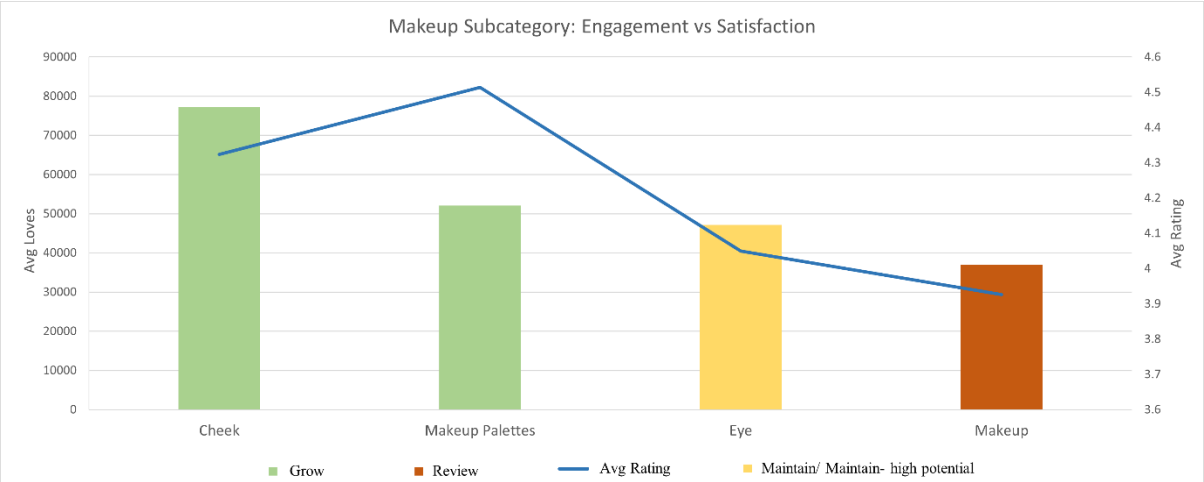
DEEP DIVE 1: MAKEUP ENGAGEMENT VS SATISFACTION GAP

Context

At the primary category level, Makeup is the portfolio's strongest performer by engagement with an average loves count of 54,243. However this headline number masks a significant internal split across its secondary categories. This deep dive examines how Makeup subcategories perform individually and where the engagement advantage is being undermined by satisfaction concerns.

Findings

Secondary Category	*Avg Loves*	*Avg Rating*	*Avg Reviews*	*Stockout %*	*Portfolio Role*
Cheek	77,177	4.32	648	4%	Grow
Makeup Palettes	52,083	4.51	265	10%	Grow
Eye	47,127	4.05	835	7%	Maintain - High Potential
Makeup	36,916	3.93	846	13%	Review



Cheek and Makeup Palettes are the portfolio's only two Grow categories, combining high engagement with strong satisfaction. Cheek in particular stands out with the highest average loves count in the entire portfolio at 77,177 alongside a solid 4.32 rating and a low 4% stockout rate. It is the most well-rounded category in the dataset.

Makeup Palettes presents a slightly different picture. Its satisfaction score is the second highest in the entire scorecard at 4.51, but it carries a 10% stockout rate. For a Grow category, this represents a direct revenue loss risk. Customer demand is clearly there but availability is not keeping pace.

Eye sits at Maintain - High Potential with strong engagement at 47,127 but a rating of only 4.05, the second lowest in this group. The category is attracting significant customer interest but not consistently delivering on expectations.

The Makeup subcategory itself is the most concerning finding in this deep dive. Despite a reasonable average loves count of 36,916, it carries the lowest rating in the group at 3.93, falling below the 4.0 threshold, and the highest stockout rate at 13%. It is the only Makeup subcategory classified as Review, and it is pulling down the primary category's overall satisfaction average.

Key Insight

Makeup's strong primary category engagement number is being driven by Cheek, Makeup Palettes, and Eye. The Makeup subcategory itself is underperforming on both satisfaction and operational availability. If left unaddressed, this creates a risk where category-level reporting masks product-level dissatisfaction, leading to misplaced investment confidence.

DEEP DIVE 2: SKINCARE HIGH SATISFACTION, LOW ENGAGEMENT

Context

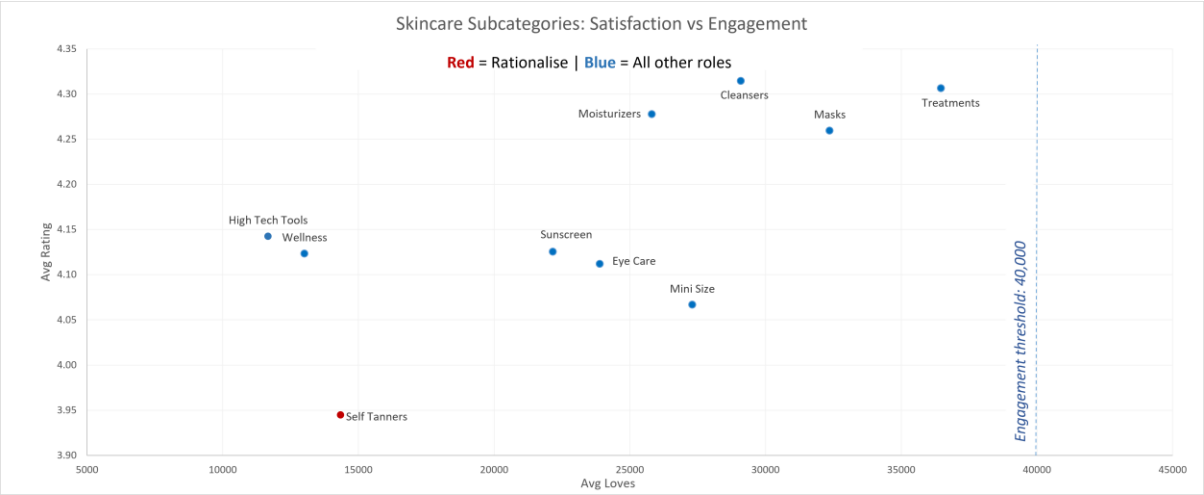
Skincare is the largest category in the portfolio by product count with 2,420 products across 13 secondary categories. It delivers a stronger average rating than Makeup at 4.23, suggesting consistent product quality across the category. However its average loves count of 27,111 significantly trails Makeup's 54,243. This deep dive examines whether this engagement gap is consistent across Skincare subcategories or concentrated in specific areas.

Note: Lip Balms and Treatments was excluded from this deep dive as an outlier. With an average loves count of 69,159, it ranks among the highest engagement categories in the entire portfolio and does not reflect the broader Skincare engagement pattern.

Findings

Secondary Category	***Avg Loves***	***Avg Rating***	***Avg Reviews***	***Stockout %***	***Portfolio Role***
Treatments	36,468	4.31	489	4%	Maintain - High Potential
Masks	32,370	4.26	426	10%	Maintain
Cleansers	29,094	4.31	565	4%	Maintain - High Potential
Mini Size	27,304	4.07	599	7%	Maintain
Moisturizers	25,823	4.28	551	4%	Maintain
Eye Care	23,900	4.11	406	5%	Maintain
Sunscreen	22,175	4.13	375	4%	Maintain
Self Tanners	14,353	3.94	201	9%	Rationalise
Wellness	13,020	4.12	133	5%	Review
High Tech Tools	11,679	4.14	78	9%	Review
Value and Gift Sets	11,025	4.14	57	20%	Review

The scatter plot below illustrates the engagement versus satisfaction distribution across Skincare subcategories. The majority of subcategories cluster in the left portion of the chart, indicating moderate to low engagement despite consistently solid ratings.



Treatments and Cleansers are the strongest performers within Skincare, both classified as Maintain - High Potential. They combine reasonable engagement with satisfaction scores above 4.3, placing them in the top satisfaction tier. These are the subcategories closest to Grow status and the most logical candidates for visibility investment.

Moisturizers, Masks, Eye Care, and Sunscreen all sit at Maintain, delivering solid ratings between 4.11 and 4.28 but failing to break through the 40,000 loves threshold. These are quality subcategories that are not being adequately surfaced to customers.

Self Tanners is the only Rationalise classification within Skincare, with the lowest rating in the group at 3.94 and engagement below 15,000. It underperforms on both dimensions and warrants assortment review.

Wellness, High Tech Tools, and Value and Gift Sets are all classified as Review, combining low engagement with only average satisfaction. Value and Gift Sets is additionally flagged for its 20% stockout rate, making it a compounding operational and performance concern within the Skincare category.

Key Insight

The Skincare category is consistently delivering quality but is systematically under-engaging customers relative to that quality. With 7 out of 11 subcategories sitting at Maintain or below despite ratings above 4.0, the issue is not product performance but portfolio visibility. This represents the most significant missed opportunity in the entire analysis. Targeted investment in surfacing high-rated Skincare subcategories to customers could deliver meaningful engagement uplift without requiring product improvement.

DEEP DIVE 3: HIGH STOCKOUT RISK CATEGORIES

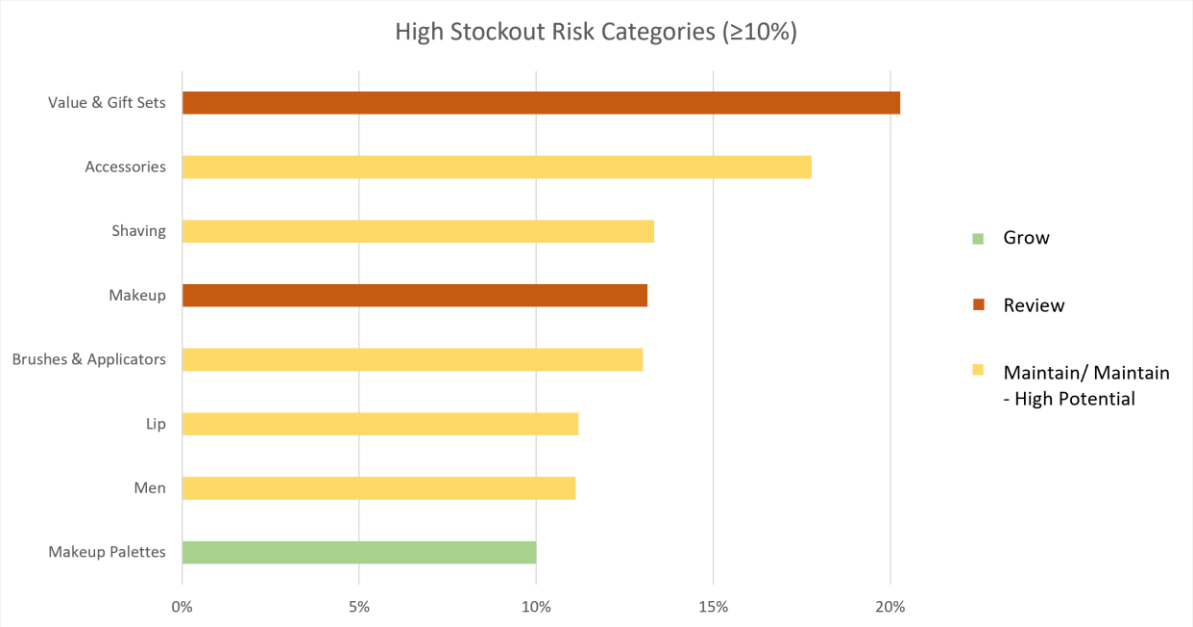
Context

Stockout risk was defined as an average out of stock rate of 10% or above at the secondary category level. A product flagged as out of stock represents a direct missed revenue opportunity. The customer intent is there but the purchase cannot be completed. This deep dive examines which categories are most affected and whether stockout risk is concentrated in underperforming or high-value segments.

Findings

Secondary Category	***Avg Loves***	***Avg Rating***	***Avg Reviews***	***Stockout %***	***Portfolio Role***
Value and Gift Sets	11,025	4.14	57	20%	Review
Accessories	20,160	4.05	490	18%	Maintain
Shaving	4,035	4.64	81	13%	Maintain - High Potential
Makeup	36,916	3.93	846	13%	Review
Brushes and Applicators	24,899	4.31	228	13%	Maintain - High Potential
Lip	70,419	4.21	540	11%	Maintain - High Potential

Men	7,587	4.55	319	11%	Maintain - High Potential
Makeup Palettes	52,083	4.51	265	10%	Grow



Eight categories meet the high stockout risk threshold of 10% or above, spanning four different portfolio roles. This spread is significant; stockout risk is not confined to underperforming categories but is present even in the portfolio's strongest segments.

Value and Gift Sets carries the highest stockout rate in the portfolio at 20%, and is simultaneously classified as Review due to low engagement and average satisfaction. This combination suggests the category is struggling operationally while also failing to justify its portfolio footprint on performance grounds.

Accessories follows at 18% stockout, classified as Maintain. With an average loves count of 20,160 and a reasonable rating of 4.05, there is underlying customer interest here that is being directly limited by availability.

The most strategically significant finding in this deep dive is Makeup Palettes. As one of only two Grow categories in the entire portfolio, a 10% stockout rate represents the highest-priority operational issue in the analysis. Customers are actively seeking this category and the business is failing to meet that demand. Every stockout in a Grow category is a direct and measurable revenue loss.

Lip is similarly concerning, with the third highest average loves count in the entire portfolio at 70,419 and an 11% stockout rate. The demand signal is exceptionally strong but availability is not keeping pace.

Shaving presents an interesting case. Despite a very low average loves count of 4,035, it carries a 13% stockout rate and the second highest rating in this group at 4.64. The category has a small but highly satisfied and loyal customer base that is regularly encountering availability issues.

Men follows a similar pattern, with the highest rating in this group at 4.55 and an 11% stockout rate. Like Shaving, it is a niche category with strong satisfaction that is underserved operationally.

Key Insight

Stockout risk in this portfolio is not a single-category problem. It cuts across portfolio roles, from the Grow category of Makeup Palettes to Review categories like Value and Gift Sets. The most urgent cases are Makeup Palettes and Lip, where high demand is being directly constrained by availability. Addressing stockout in these two categories alone would likely deliver an immediate and measurable revenue impact.

STRATEGIC RECOMMENDATIONS

Overview

The following recommendations are drawn directly from the scorecard findings and deep dives. They are organised by priority and address four areas: investment in Grow categories, visibility expansion for high-satisfaction segments, assortment rationalisation, and operational improvements.

Recommendation 1: Protect and Prioritise Grow Categories

Cheek and Makeup Palettes are the only two categories that demonstrate strength across both engagement and satisfaction. These categories should receive priority attention in terms of marketing investment, homepage placement, and campaign featuring.

Makeup Palettes specifically requires immediate attention on inventory. A 10% stockout rate in the portfolio's strongest segment is a direct revenue loss that can be addressed operationally without any product or marketing investment.

Expected impact: Revenue protection in the portfolio's highest performing segments and reduced lost sales from stockout.

Recommendation 2: Invest in Skincare Visibility

The Skincare category consistently delivers strong product quality but is systematically under-engaging customers. Treatments, Cleansers, and Moisturizers all carry ratings above 4.2 but fail to break through the engagement threshold.

The recommended action is to increase marketing visibility for high-rated Skincare subcategories through homepage placements, cross-category recommendations from Makeup to Skincare, and targeted campaigns that lead with product quality and customer reviews rather than price.

Expected impact: Engagement uplift in a category that already has the quality foundation to support it, reducing the portfolio's over-reliance on Makeup as the primary engagement driver.

Recommendation 3: Address Stockout in High Demand Categories

Lip carries an average loves count of 70,419, the third highest in the portfolio, alongside an 11% stockout rate. Accessories carries an 18% stockout rate with underlying customer interest. These are not low-priority categories experiencing occasional availability issues; they are high-demand segments regularly failing to convert customer intent into purchase.

The recommended action is to review inventory planning and replenishment cycles for Lip, Accessories, Brushes and Applicators, and Men, prioritising availability improvements before any additional marketing investment is made in these categories.

Expected impact: Direct conversion of existing customer demand into completed purchases without requiring additional engagement investment.

Recommendation 4: Review Underperforming Categories Before Further Investment

10 categories are currently classified as Review, including Makeup (subcategory), Fragrance, and Value and Gift Sets. Before any additional assortment expansion or marketing investment is directed at these categories, a deeper product-level review is recommended to identify whether underperformance is driven by specific products, pricing misalignment, or structural demand issues.

Expected impact: Reduced risk of over-investing in categories that may not respond to additional investment without underlying product or positioning changes.

Recommendation 5: Rationalise or Reposition Self Tanners, Nail, and Hair

These three categories are the only Rationalise classifications in the portfolio, underperforming on both engagement and satisfaction. The recommended action is to review the assortment within each category and consider reducing product count, consolidating into adjacent categories, or repositioning with a clearer value proposition before the next planning cycle.

Expected impact: Reduced operational complexity and freed-up resources that can be redirected toward higher-performing segments.

Recommendation 6: Investigate Niche High-Satisfaction Categories

Men, Shaving, Hair Tools, and Beauty Supplements all carry satisfaction scores above 4.4 but very low engagement. These are small, loyal customer segments that are currently underserved both in assortment size and visibility. A targeted expansion or visibility test in one of these categories, particularly Men given its relatively higher review count of 319, could reveal whether demand can be grown without sacrificing the satisfaction levels that make these categories distinctive.

Expected impact: Potential to develop a new engagement driver from a currently underleveraged but high-quality segment.

LIMITATIONS AND NEXT STEPS

Limitations

Snapshot data only The dataset represents a single point in time. Engagement, ratings, and stockout figures reflect current status and cannot account for seasonal variation, trend cycles, or how category performance has changed over time. Findings should be interpreted as a current state assessment rather than a long-term performance evaluation.

Loves count as an engagement proxy Loves count measures the number of users who saved a product as a favourite. While it is a reliable indicator of customer interest, it does not directly measure purchase intent or actual sales volume. A product can be loved without being purchased, meaning engagement density may overstate commercial performance in some categories.

Stockout as a binary flag The out of stock field is a binary indicator with no timestamp or duration information. It is not possible to determine how long a product has been out of stock, how frequently

stockouts occur, or whether the flag reflects a temporary or structural availability issue. Stockout percentages should be treated as directional signals rather than precise operational measures.

Rating coverage 278 products, approximately 3.3% of the working dataset, had no rating or review data and were excluded from satisfaction calculations. If unrated products are systematically concentrated in specific categories, satisfaction averages for those categories may be slightly overstated.

Price segment limitation Price segment was derived at the product level and was not used in the scorecard. Aggregating price to category level would be misleading as a single secondary category can span multiple price tiers. Future analysis could benefit from examining performance within price tiers inside each category rather than across categories.

Shop by Concern Shop by Concern was retained in the dataset as it appeared as a secondary category in the raw data, but functions as a navigation and merchandising label rather than a true product category. It should be excluded in future iterations of this analysis.

Next Steps

Incorporate time-series data Adding historical engagement and rating data would allow trend analysis, identifying whether categories are growing or declining over time and making the scorecard more robust as a planning tool.

Product-level drill down for Review and Rationalise categories The scorecard operates at category level. The next logical step for categories flagged as Review or Rationalise is a product-level analysis to identify whether underperformance is driven by a small number of specific products or is a category-wide issue.

Validate stockout findings with inventory data Connecting the stockout flag to actual inventory and sales data would allow a more precise calculation of lost revenue from stockout events, making the business case for inventory investment more concrete.

Repeat the scorecard quarterly The Portfolio Health Scorecard is designed to be repeatable. Running it on a quarterly basis would allow the business to track Portfolio Role movements over time, identify categories that are improving or deteriorating, and measure the impact of actions taken based on these recommendations.

Expand visibility analysis for Skincare A dedicated campaign test increasing visibility for Treatments and Cleansers would provide direct evidence of whether the engagement gap in Skincare is driven by discovery limitations or by lower underlying demand, informing future investment decisions.
